

ASTUS GARMIN

Interact With Your Drivers

Garmin and Astus are combined for unparalleled efficiency.

By uniting the features of a GPS navigation screen with the tools provided by the Astus Tag solution, we've taken GPS to a whole new level!

With the Astus Garmin combination you'll be able to communicate with your drivers in real time, while assigning them tasks. By sending the destination address from Astus software, the itinerary will be automatically calculated when received by the Garmin device.

Follow your employees' routes, log in fuel consumption, and plan their itineraries with accurate ETA. Take advantage of the savings in precious cellular talking time, all the while reducing possible misunderstandings due to the lack of communications traceability.

Features

In addition to basic GPS features (address search, turn-by-turn navigation) we've incorporated new functions that will benefit any fleet of vehicles:

- Two-way messaging between vehicle and Astus 2012 in predefined or free text format, and in urgent or regular format
- Itinerary and task dispatching
- Real-time route tracking in Astus 2012 software
- Driver identification and status notification
- Estimated time of arrival taking traffic conditions into consideration
